How is teaching mathematics well related to knowing and being "good at" mathematics?

© 2007 Mathematics Teaching and Learning to Teach

The ambitious goal of a more mathematically skilled population

- Goals for mathematical proficiency have increased and broadened over the last 50 years
  - Who needs to be successful with math
  - What mathematical proficiency is
  - What is important to learn
- This is not "reform," but radical renovation

© 2007 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu

The role of teachers, and the problem

- Teachers are key to this ambition: any other tool (e.g., technology, curriculum, class size, time) depends on teachers' capacity to manage and use the tool and to help students do so

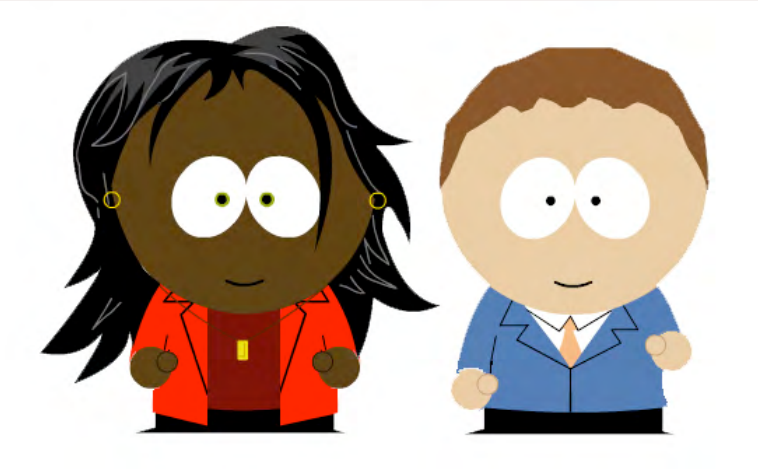

But --

- We have a shortage of qualified and skilled teachers, and
- We do not reliably prepare or support people to teach mathematics in ways that meet these aspirations

© 2007 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu
Please do not circulate or cite without permission

How can we develop and support the teachers we need?

- One favored approach: recruit mathematically skilled people into teaching

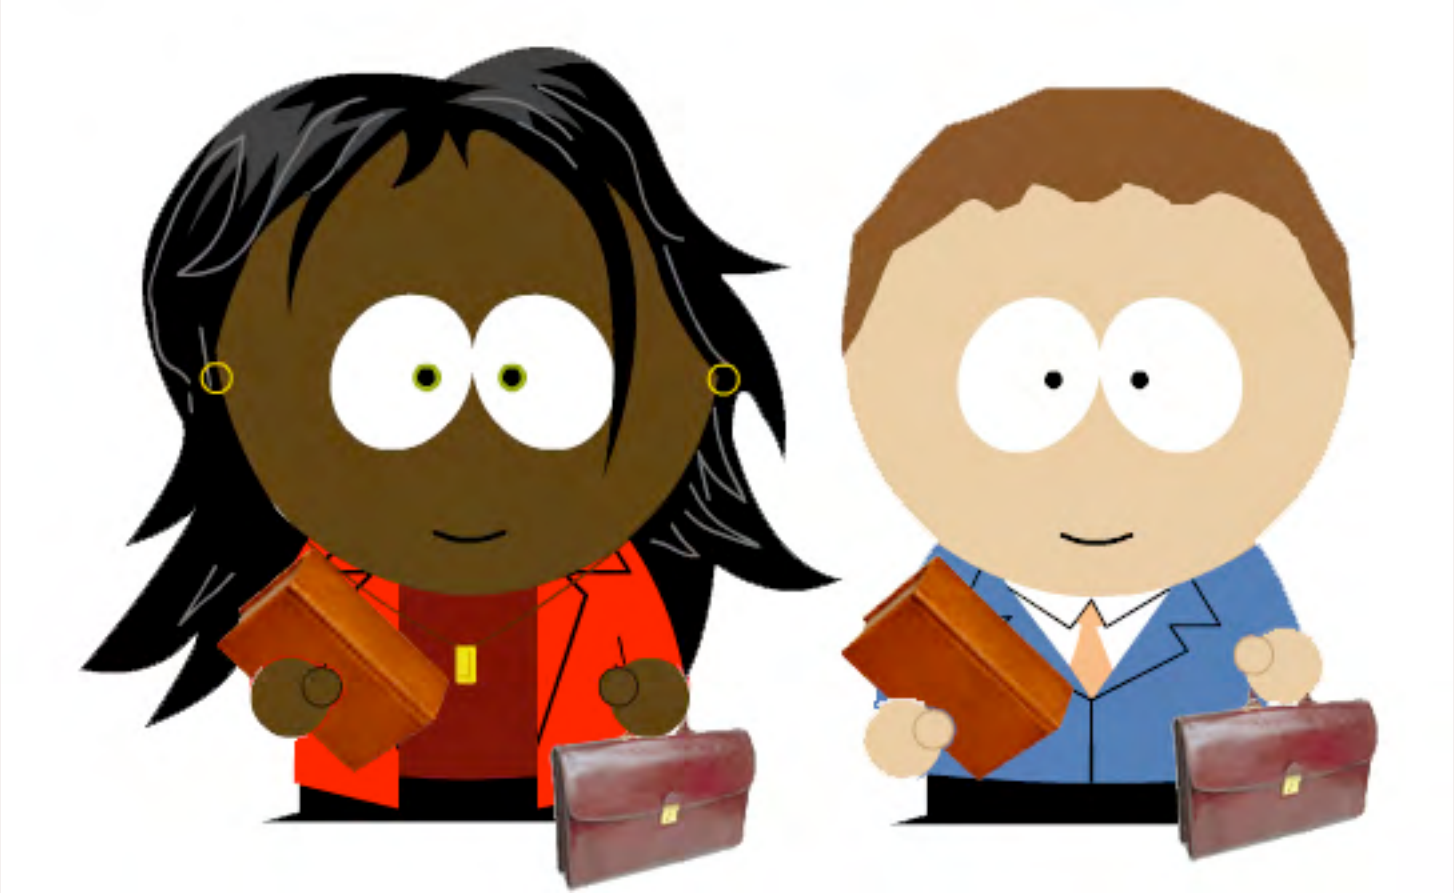

© 2007 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu
Please do not circulate or cite without permission

Why does recruiting mathematically skilled people to teaching seem to make sense?

1. They know math.
2. They like math and can show students why it matters.
3. They can serve as good role models.
4. They are "smart."

How sensible is this view?

Consider some obvious mathematical demands of teaching. What do teachers do?

- Use textbooks
- Present content (either from the textbook or by one's own design)
- Show students how to solve problems
- Answer students' questions
- Assess students' work (responses in class, homework, tests)

These all require knowing mathematics.

A closer view: Teaching as mathematical work

- Using and analyzing representations, and mapping across different kinds of representations
- Defining terms and attending closely to language
- Using and inventing notation
- Producing and analyzing explanations
- Generating simpler and more complex versions of a problem
- Asking mathematical questions
  - Why does this work? Does this work in all cases? Do we have all the solutions? How are these two representations related?
- Thinking of special cases
  - Boundary cases, or examples that might push an initial idea

Attending closely to language: Do these correctly define "even number"?

1. A number that can be divided in two equal parts with nothing left over is even.
2. A whole number is even if it can be divided into groups of 2 with nothing left over.
3. A number with 0, 2, 4, 6, or 8 in the ones place is even.

Is 7 even?

Is 32.7 even?

Teaching as mathematically "natural" work, and the limits of this perspective

- Some aspects of teaching depend on mathematical instincts, habits of mind, practices
- So the additive view of learning to teach may make sense — add other knowledge to mathematical knowledge and habits

but —

- Teaching mathematics also involves doing things that are mathematically *unnatural*

© 2007 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu

Teaching is itself unnatural work

Common ways of being

1. Telling and showing others, doing things for people
2. Being "yourself"
3. Assuming you know what others mean
4. Correcting and smoothing over mistakes
5. Assuming others experience things as you do
6. Liking/disliking people

Ways of being in teaching

1. Listening and watching others, help others do
2. Being in professional role
3. Probing others' ideas
4. Provoking disequilibrium and error
5. Not presuming shared identity; seeking to learn others' experiences and perspectives
6. Seeing people more descriptively

The specific case of mathematics teaching as mathematically unnatural work

1. Unpacking mathematical ideas
2. Listening to mathematically imprecise language
3. Not automatically affirming correct statements
4. Hearing what others say, not what you think
5. Surfacing "error"

© 2007 Mathematics Teaching and Learning to Teach

Example #1: Unpacking mathematical ideas

What makes this unnatural?

Mathematics aims for compression and consolidation.

© 2007 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu

What is a fraction (1)?

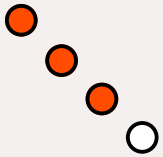

A fraction is a representation of a rational number of the form a/b, where a and b are integers and $b \neq 0$.

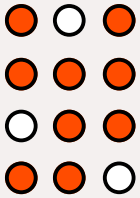

A rational number is a real number representable as a quotient of two integers, with the denominator $\neq 0$.

Please do not circulate or cite without permission

Example #1: Unpacking mathematical ideas

- As ideas are learned, the elements of the ideas need to be encountered and developed to get to a more finished understanding
- To teach a concept or a procedure, must see the core constituents in order to stage and sequence learning, to construct representations, to hear

© 2007 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu
Please do not circulate or cite without permission

Example #2: Listening to mathematically imprecise language

What makes this unnatural?

Mathematics depends on precision; is a strictly denotative language. Taking things literally and not making inferences is a value.

© 2007 Mathematics Teaching and Learning to Teach

Please do not circulate or cite without permission

Example #2: Listening to mathematically imprecise language

- As students learn, they necessarily express themselves informally -– and imprecisely.
- This requires:
  - Listening generously and making inferences to interpret
  - Tolerating imprecision and assuming sense-making
  - Figuring out ways of probing what students do mean

© 2007 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu
Please do not circulate or cite without permission

Example #3: Not automatically affirming correct statements

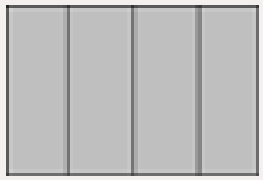

What makes this unnatural?

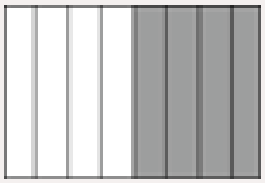

When correct statements are made, important to mark their truth.

© 2007 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu
Please do not circulate or cite without permission

Why not say, "Good, that's right" to Lin?

"I think this one *(the four fourths)* is bigger because um four eighths, that's only like a half and this *(the four fourths)* is a whole piece."

Video clip #2

© 2007 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu
Please do not circulate or cite without permission

Example #3: Not automatically affirming correct statements

- Just because something correct is said doesn't ensure understanding.
- A culture of mathematical reasoning must consistently place authority on verified explanations.

© 2007 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu
Please do not circulate or cite without permission

Example #4: Hearing what others say, not what you think

What makes this unnatural?

Mathematical frameworks provide a strong orienting instinct; they are difficult to suspend.

© 2007 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu
Please do not circulate or cite without permission

What is Shea's idea?

"I was just thinking about six, that it's a . . . I'm just thinking. I'm just thinking it can be an odd number, too."

Video clip #3

© 2007 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu
Please do not circulate or cite without permission

Example #4: Hearing what others say, not what you think

- When students talk, focusing on what they say and what they might mean without your own strong mathematical overlay
- Suspending assumption of "misconception" and attribution of "error"

© 2007 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu
Please do not circulate or cite without permission

Example #5: Surfacing and taking up "error"

What makes this unnatural?

Mathematical instinct is to critique and correct and to not allow incorrect or sloppy statements to stand.

© 2007 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu
Please do not circulate or cite without permission

Why take up Kevin's claim that he "did it wrong"?

"First I did something different and then I was wrong."

Video clip #4

© 2007 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu
Please do not circulate or cite without permission

Example #5: Surfacing and taking up "error"

- Learning involves sensible efforts that run amuck; discussing and analyzing these can develop stronger understanding
- Some apparent "errors" are not errors at all (e.g., Shea)
- This requires suppressing "natural" desires to:
  - Protect students from "exposure"
  - Correct "wrong" statements

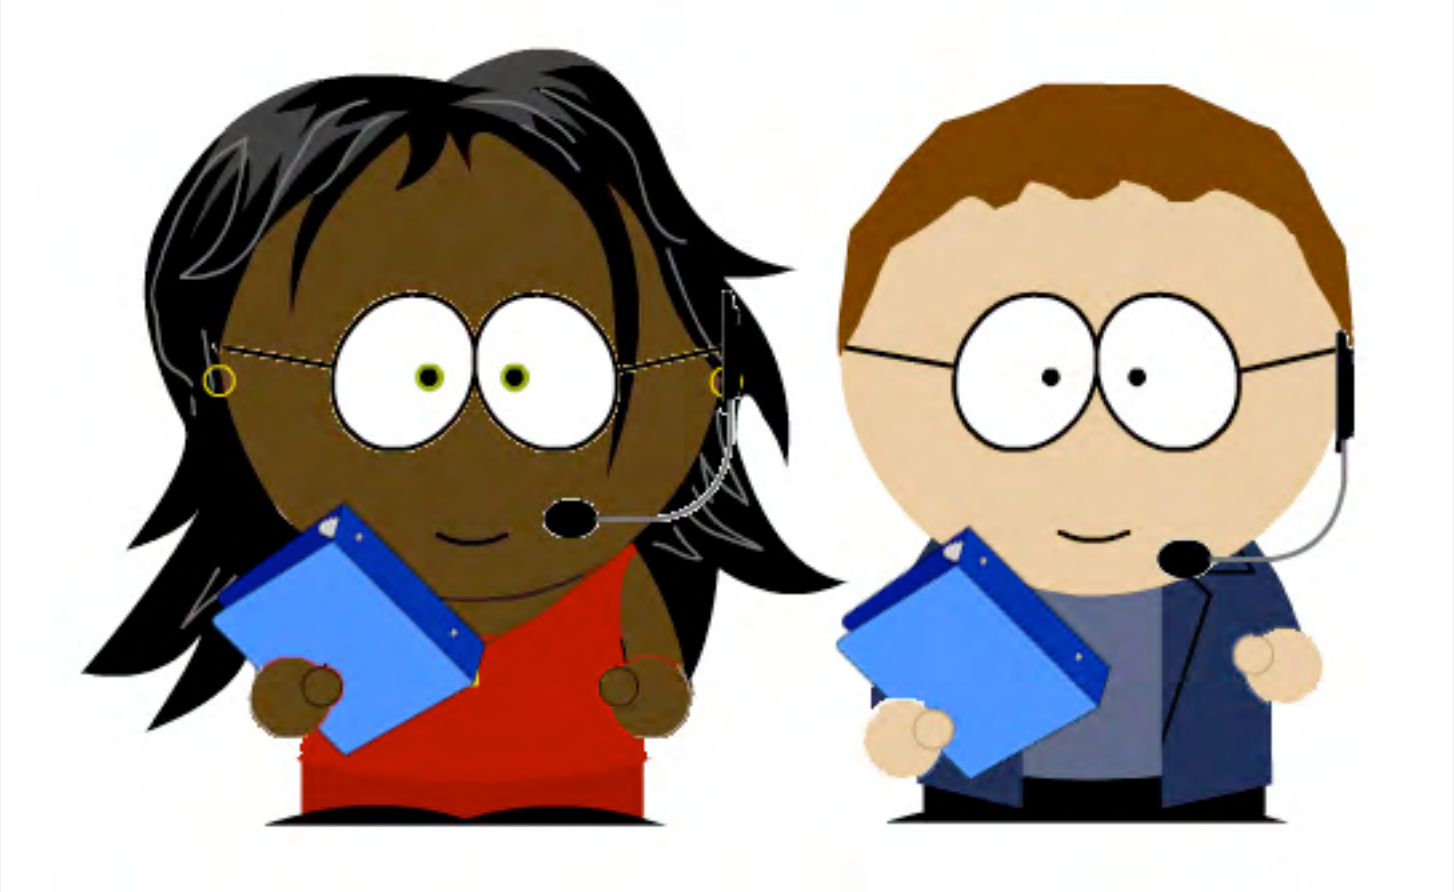

© 2007 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu
Please do not circulate or cite without permission

Teaching mathematics is not a natural extension of learning mathematics

- Teaching is not just about being "yourself" mathematically
- Being "smart" in teaching requires some crucial skills and habits that are not just extensions of other mathematics learning
- Major implications for equity and ambitious goals for renovating mathematics education
- Teaching is a role; teaching mathematics means acquiring new instincts and habits, new ways of seeing mathematically that are specialized for the work of teaching

© 2007 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu

The challenge of learning to teach mathematics

- Although it may seem logical to "add" knowledge and skills to a strong mathematical base, teaching also requires learning to do and think mathematically that are not "natural"
- Professional education must help teachers engage in unnatural activity that is not automatically learned from learning math or gaining experience

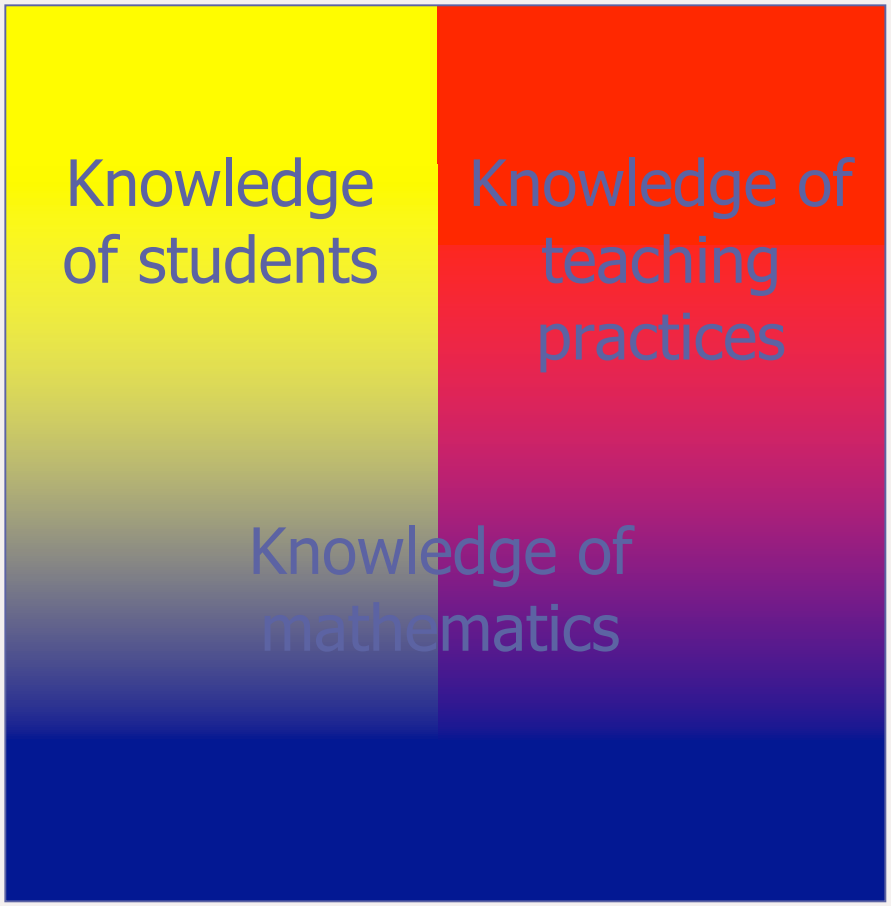

© 2007 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu
Please do not circulate or cite without permission

An additive view

© 2007 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu
Please do not circulate or cite without permission

A more transformative view

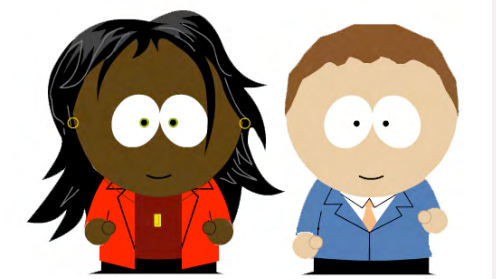

© 2007 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu
Please do not circulate or cite without permission

Questions

1. How can mathematically skillful people be helped to make this sort of transformation?
2. How do people who enter with strong conventional mathematics backgrounds compare with those whose mathematical skill is grown from being teachers?
3. How can mathematical instincts for teaching be developed?
4. Are there similar phenomena in other fields?
5. How can professional education prepare people for the mathematical work of teaching and how it can it be best tailored for different kinds of entrants?

© 2007 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu
Please do not circulate or cite without permission

Our challenge

- The policy environment demands "qualified teachers" without good evidence of what constitutes "qualification"
- Common sense triumphs in the absence of solid evidence for alternatives
- Teaching mathematics is not natural; good professional education matters: what are the forms that that can take and what is the evidence of their comparative advantage?
- As professional mathematics teacher education community, we need to step up
