Two senses of "proving the impossible"

1. Proving impossibility in mathematics: A problem with no solution
2. Proving possibility in teaching: "My students could never do this."

Overview

1. What is mathematical proof, and why does it matter?
2. What is involved in teaching proving in school?
3. Scaffolding in teaching proving: three key resources:
   - the tasks
   - mathematical language
   - the social and intellectual culture

Proving is central to mathematics

- The basis of knowing that something is true
- Search for proof can help determine what is plausible
- A basic mathematical skill and disposition

© 2008 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu

Proving is central to mathematical proficiency

- Supports sense-making and understanding
- Eases retention and retrieval
- Affords intellectual authority and independence

© 2008 Mathematics Teaching and Learning to Teach

Example: odd + odd = even

7 + 9 = 16

1 + 5 = 6

3 + 11 = 14

5 + 13 = 18

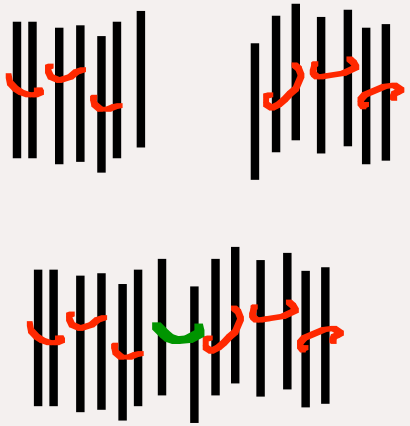

7 + 3 = 10

2467 + 1 = 2468

-3 + 5 = 2

-3 + 3 = 0

(n2 +1) + (j2 + 1) = (n + j + 1)2

What kinds of claims do proofs prove?

1. **Generality**: That something is true for all cases.
2. **Properties**: Features or properties of certain mathematical objects, possibly to characterize them uniquely.
3. **Classification**: Finding all examples of a class.

1. **Equivalence**: That two or more things are the "same."
2. **Existential**: That something exists or does not exist.

1. odd + odd = even

1. Every positive integer is a sum of four squares (e.g., $5 = 0 + 0 + 1 + 4$; $9 = 0 + 1 + 4 + 4$)

2. There are six solutions to the problem, "I have pennies, nickels, and dimes in my pocket. If I pull out two coins, how much money might I have?"
3. $1 + 3 + 5 + \ldots + (2n - 1) = n^2$
4. There is no solution to $b \div 0$.

Foundations of proof

1. Common knowledge
   - Already-established concepts, definitions, theorems
2. Mathematical language
   - Definitions, precision
   - Logic and syntax
3. Intellectual community
   - Social imperative, goal to convince others

Our claim

Young students—even those who are not succeeding in school mathematics—can learn to prove complex mathematical claims.

Making this possible entails intricate instructional work.

The setting:
Elementary Mathematics Laboratory (EML)

- A live laboratory for the design and study of teaching
  - Direct summer program for children in local school district (working class community, under-resourced district, falling achievement)
  - Live setting for the study of teaching, learning, and mathematics
  - Source of records of practice

2007 EML

- 27 students, entering fifth grade, unsuccessful in school math
- 2½ hours per day
- Mathematical content: Fractions (definitions, representations), proving an impossible combinatorics problem
- Mathematical skills: explaining, representing, proving

The work of teaching proving

Scaffolding students' mathematical work by—

1. Choosing and using an appropriate task
2. The development of specialized mathematical language
3. The construction of the social and intellectual culture

The task: The EML Train Problem

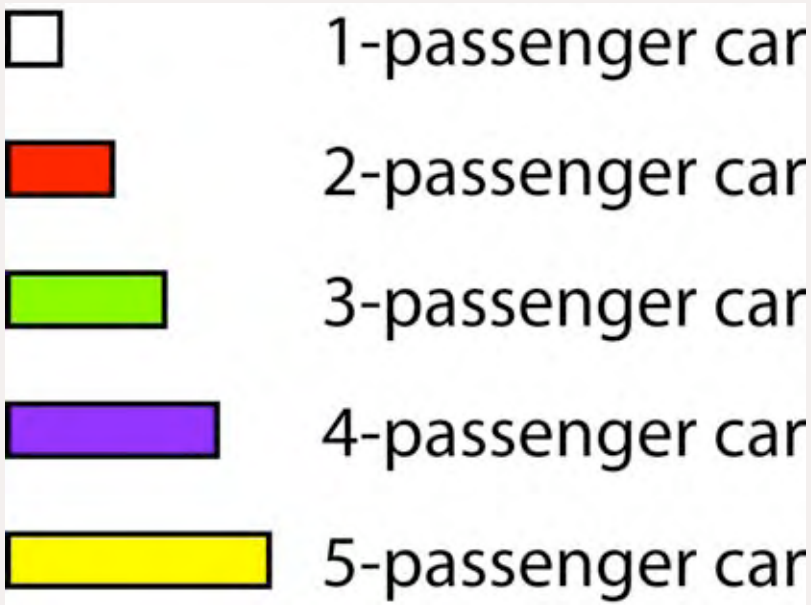

Mr. Howe wants to order a special five-car train that uses one of each of the different-sized cars. He wants to be able to break apart his 5-car train to form smaller trains that hold exactly 1 to 15 people. In addition, he wants to be able to form these smaller trains using cars that are next to each other in the larger train.

Can the EML Train Company fill Mr. Howe's order? Explain how you know.

© 2008 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu

Problem representation: Cuisenaire rods

The five cars used:

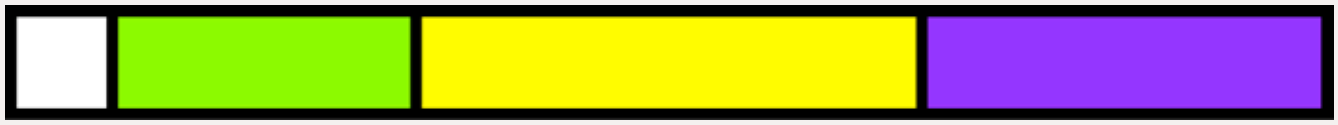

The basic rule:

All trains must use

only these cars, and

none more than once.

Example: A 13-passenger train.

© 2008 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu
Please do not circulate or cite without permission

The enormity of the problem

- The number of possible orderings of 1,2,3,4,5 is 5! = 120

  . . . but there is **no** solution

How to prove this without trying every case?

© 2008 Mathematics Teaching and Learning to Teach

Mathematical background

Consider the numbers 1, 2, 3, 4, 5. What sums can we make using only these numbers, each one at most once?

For example,

$$1 + 2 + 3 + 4 + 5 = 15$$

is the maximum possible.

What other numbers can we get?

© 2008 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu

The Train Problem's numerical form

Arrange the numbers 1, 2, 3, 4, 5 in some order.

One example:

1	5	3	4	2

Can you find such an ordering of the numbers so that each number from 1 to 15 is a sum of consecutive terms in our list?

For any ordering we can clearly get the sums 1, 2, 3, 4, 5, and 15.

For the example above you can also get:

$6 = 1 + 5, \quad 7 = 3 + 4, \quad 8 = 5 + 3, \quad 9 = 3 + 4 + 2$

What else can you get?

Staging students' work

Phase I	**The Train Problem, Part 1** **Trains for 1 - 15 passengers** **(Showing what is possible)**	**Practice with the basic elements of the problem, establish common knowledge of the materials and developing norms of explaining solutions**
Phase II	The Train Problem, Part 2	Setting a context for the problem that supports the core mathematical work, captures students' attention, and does not distort or distract
Phase III	White-red ends (David's Conjecture)	Focusing the students' work from empirical experimentation to more systematic inquiry
Phase IV	The only way to get 13 and 14 (The clue from Mrs. Howe)	Provoking the need to prove and further focusing the students' work
Phase V	Six white-red end trains (Reducing the size of the problem)	Building a key sub-part of the proof
Phase VI	Consolidating and assembling the proofs (Showing impossibility)	Organizing the argument
Phase VII	Final report to Mr. Howe	Experiencing the sense of conviction

Tasks

Opportunities for learning proof

- Empirical exploration; finding patterns, conjectures
- Structured record keeping
- Representation (physical, written, oral) of mathematical ideas
- Articulation and justification of mathematical claims
- Critical analysis and evaluation of the arguments of others
- Confrontation with an existential claim: discovering and proving impossibility

Housing the mathematics

- A context that can hold the problem and provide language and structure
- An imperative for seeking conviction (proof)
- Tools to represent the mathematics
- Unpacking the problem at key joints (part 1, permuting cars, red/white on ends)

© 2008 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu
Please do not circulate or cite without permission

Mathematical language

- Phrasing the task ("be able to form these smaller trains using cars that are next to each other in the larger train")
- Articulate and unpack *conditions* (Lampert, 2001)
- Hearing the difference and unpacking the logical difference between formulations ("should" versus "have to")

© 2008 Mathematics Teaching and Learning to Teach
School of Education • University of Michigan • Ann Arbor, MI 48109-1259 • (734) 615-7235 • mtlt@umich.edu
Please do not circulate or cite without permission

Social and intellectual culture

- Students' explicit responsibility to attend to others' ideas
- Active respect for ideas and classmates, learning to critique
- Using Mr. Howe and his wife as clients of the EML Train Company to represent the social imperative for proof

© 2008 Mathematics Teaching and Learning to Teach

Conclusions

1. Students can be interested in and sustain work on a complex proof
2. Complex work can build students' mathematical proficiency, rather than merely depend on it
3. Three key resources for scaffolding students' learning:
   - the choice and use of the task
   - attention to mathematical language
   - the development of an intellectual culture
