PROBLEM SET 7 (DUE ON THURSDAY, APRIL 8)

(All Exercises are references to the November 18, 2017 version of *Foundations of Algebraic Geometry* by R. Vakil.)

Problem 1. Exercise 19.11.B (a map of projective varieties not arising from a map of (regraded) graded rings)

Problem 2. Suppose (E, p) is a (smooth) elliptic curve in Weierstrass form $y^2 = x^3 + ax + b$ (along with the point at infinity p, so really $E = \operatorname{Proj} k[x, y, z]/(y^2z - x^3 - axz^2 - bz^3)$). Show that the rational section dx/y of $\Omega_{E/k}$ actually has no zeroes or poles in E, so it generates $\Omega_{E/k} \cong \mathcal{O}_E$.

Problem 3. Let $\iota : C \to \mathbb{P}^2_k$ be the inclusion of a smooth plane curve of degree $d > 0$. Let $\mathcal{F} = \iota^*\Omega_{\mathbb{P}^2/k}$, a rank 2 vector bundle on C. Compute the Euler characteristic $\chi(C, \mathcal{F})$.

Problem 4. Exercise 21.5.D ($h^0(X, K_X)$ for a degree d surface X in $\mathbb{P}^3$. Hint: use adjunction to compute K_X as the restriction of a line bundle on $\mathbb{P}^3$, then pushforward to $\mathbb{P}^3$ and compute cohomology there using a long exact sequence and the known values of $h^i(\mathbb{P}^3, \mathcal{O}(m))$.)
