

1 Products of compact spaces

In this handout, we will prove the following theorem.

Theorem 1.1. (Products of compact spaces). *Let (X, \mathcal{T}_X) and (Y, \mathcal{T}_Y) be nonempty topological spaces. Then $X \times Y$ is compact with respect to the product topology $\mathcal{T}_{X \times Y}$ if and only if both X and Y are compact.*

In-class Exercises

- Let (X, \mathcal{T}_X) and (Y, \mathcal{T}_Y) be two nonempty topological spaces. Suppose that their Cartesian product $X \times Y$ is compact with respect to the product topology $\mathcal{T}_{X \times Y}$. Prove that X and Y are compact.
- Let (X, \mathcal{T}_X) and (Y, \mathcal{T}_Y) be nonempty compact topological spaces. Let \mathcal{U} be any open cover of $X \times Y$ (with the product topology).

For this exercise, we will call a subset $A \subseteq X$ *good* if $A \times Y$ is covered by a finite subcollection of open sets in \mathcal{U} . Our goal is to show that X is good.

- Suppose that A_1, \dots, A_r is a finite collection of good subsets of X . Show that their union is good.
- Fix $x \in X$. For each $y \in Y$, explain why it is possible to find open sets $U_y \in X$ and $V_y \in Y$ so that $(x, y) \in U_y \times V_y$ and $U_y \times V_y$ is contained in some open set in \mathcal{U} .
- Explain why there is a finite list of points $y_1, \dots, y_n \in Y$ so that the sets $\{V_{y_1}, \dots, V_{y_n}\}$ cover Y .
- Define

$$U_x = U_{y_1} \cap U_{y_2} \cap \dots \cap U_{y_n}.$$

Show that U_x is a good set, and is an open subset of X containing x . This shows that every element $x \in X$ is contained in a good open set U_x .

- Consider the collection of open subsets $\{U_x \mid x \in X\}$ of X . Use the fact that X is compact to conclude that X is good.
- (Optional).**

Definition (Lindelöf). A topological space X is called *Lindelöf* if every open cover of X has a countable subcover.

Suppose that X is a Lindelöf space and Y is a compact space. Prove that the product $X \times Y$, with the product topology, is Lindelöf.

- (Optional).** Recall that a map of topological spaces is called *closed* if the image of every closed set in the domain is a closed subset of the codomain.

Let X and Y be topological spaces, and endow their product $X \times Y$ with the product topology. We saw on Worksheet #7 Problem 4 that the projection map $\pi_X : X \times Y \rightarrow X$ need not be closed in general. Prove that, if Y is compact, then π_X is a closed map.
